REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: Claims 1-24 are considered allowable since when reading the claims in light of the specification, none of the references of record alone or in combination disclose or suggest the combination of limitations specified in the independent claims. The prior art of record (US Patent # 6,032,019) relates to methods and apparatus for transmitting digital data in a cable television network systems. The device includes a media access control address, a downstream receiver and demodulator, an echo logic device, and an upstream modulating and transmitting mechanism. The prior art of record (US Patent # 6,650,698) relates to an apparatus and method for minimizing nonlinear distortions in computer system communications where the upstream signal from a client modem to a server modem is periodically sampled, the samples being utilized by a non-linear decision feedback equalizer to periodically produce sets equalizer coefficients. The equalizer coefficients are sent via an independent communication channel down-stream to the client modem to continuously update distortion-minimizing adjustments to the client modem's upstream output. As to claims 1-8, the prior art of record does not teach a media access controller (MAC) that generates for downstream transmission MAP messages that assign time slots in which cable modems may transmit signal bursts on the upstream channel, the MAP messages including idle slots that are assigned to no cable modems. As to claims 9-11, the prior art of record does not teach a notch filter connected to the demodulator, the notch filter having coefficients that

Art Unit: 2667

are adjustable to cancel noise applied to the demodulator; a decision feedback equalizer coupled to the demodulator, the decision feedback equalizer including a feed forward filter for establishing pre-equalization coefficients. As to claims 12-17, the prior art of record does not teach transmitting on a downstream channel from the CMTS to a plurality of cable modems MAP messages that assign time slots in which cable modems may transmit signal bursts on the upstream channel, the MAP messages including idle slots that are assigned to no cable modems; compensating for the monitored conditions on the upstream channel. As to claims 18-23, the prior art of record does not teach receiving on the compensated upstream channel a ranging signal from one of the cable modems; adjusting filter coefficients to compensate for inter symbol interference on the upstream channel responsive to the received ranging signal; transmitting the adjusted coefficients on a downstream channel to the cable modem for the purpose of pre-equalization of the upstream channel. As to claim 24, the prior art of record does not teach a receiver for processing equalization coefficients returned by the CMTS, the returned equalization coefficients not reflecting noise received by the CMTS; an equalizer connecting the source to the transmitter to send the data to the CMT, the returned coefficients being impressed on the equalizer to pre-equalize the data sent to the CMTS without reflecting noise received by the CMTS.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
